Introduction

The **Hotel Reservation System** is a database management project designed to efficiently handle hotel operations such as booking, customer management, room availability, and payment tracking. This system stores, organizes, and retrieves hotel data through structured SQL queries, enabling easy access to information and reducing manual errors.
It provides a centralized database that connects multiple entities — such as **customers, rooms, reservations, employees, and payments** — through relational tables. The project ensures data consistency, integrity, and reliability by using **primary and foreign key relationships**.

The main purpose of this project is to **design a relational database** that simplifies hotel management processes and provides **accurate, real-time insights** for decision-making using SQL queries.

- Store and manage customer and reservation data securely.
- Track room availability and types(Standard,Deluxe,Suite).
- Manage Employee and Staff Information.

About the Data

```sql
CREATE TABLE Hotels (
    hotel_id INT PRIMARY KEY,
    hotel_name VARCHAR(100),
    location VARCHAR(100),
    rating DECIMAL(2,1),
    total_rooms INT,
    contact_number VARCHAR(15),
    email VARCHAR(100)
);
```

```sql
CREATE TABLE Rooms (
    room_id INT PRIMARY KEY,
    hotel_id INT,
    room_number VARCHAR(10),
    room_type VARCHAR(50),
    price_per_night DECIMAL(10,2),
    capacity INT,
    availability_status VARCHAR(20),
    FOREIGN KEY (hotel_id) REFERENCES Hotels(hotel_id)
);
```

```sql
CREATE TABLE Customers (
    customer_id INT PRIMARY KEY,
    first_name VARCHAR(50),
    last_name VARCHAR(50),
    email VARCHAR(100),
    phone_number VARCHAR(15),
    nationality VARCHAR(50),
    id_proof VARCHAR(50)
);
```

Problem Statement

❖ Average Revenue Generated By Hotels

```
# Revenue By Hotels
SELECT h.hotel_name, SUM(p.amount_paid) AS total_revenue
FROM Payments p
JOIN Reservations r ON p.reservation_id = r.reservation_id
JOIN Rooms ro ON r.room_id = ro.room_id
JOIN Hotels h ON ro.hotel_id = h.hotel_id
GROUP BY h.hotel_name
ORDER BY total_revenue DESC;
```

Result Grid | Filter Rows:

hotel_name	total_revenue
Sea View Resort	73500.00
Blue Orchid Hotel	28000.00
Desert Mirage	21600.00
Royal Palace	20800.00
Mountain Bliss Inn	20000.00
Green Valley Resort	9600.00

Insights

Identify which hotels generate the **highest total revenue** — these are your best-performing hotel locations.

fter analysis it was found that Sea View Resort generated highest revenue of 73500 and Green Valley Resort generated lowest revenue of 9600

Compare revenue with occupancy rate — a hotel with **high occupancy but low revenue** might need optimization.

© All rights reserved by Fireblaze Technologies Pvt. Ltd.

Problem Statement

❖ Total Number Of Bookings Per Hotel

```
# Total Number of Bookings Per Hotel
SELECT h.hotel_name, COUNT(r.reservation_id) AS total_bookings
FROM Reservations r
JOIN Rooms ro ON r.room_id = ro.room_id
JOIN Hotels h ON ro.hotel_id = h.hotel_id
GROUP BY h.hotel_name
ORDER BY total_bookings DESC;
```

Result Grid | Filter Rows:

hotel_name	total_bookings
Blue Orchid Hotel	3
Sea View Resort	3
Mountain Bliss Inn	2
Royal Palace	2
Desert Mirage	1
Green Valley Resort	1

Insights

Identify which hotels receive the **highest number of total bookings.**

Compare total bookings by **hotel location** to find which cities or regions attract more guests.

Blue Orchid Hotel In Mumbai and Sea View Resort In Goa have number of hotel bookings because they are prime tourist locations due to very famous places to visit.

Useful for identifying **tourist hotspots** or **business travel hubs**.

© All rights reserved by Fireblaze Technologies Pvt. Ltd.

Problem Statement

❖ Which Room type is most popular

```sql
# Most Popular Room Type
SELECT room_type, COUNT(*) AS total_bookings
FROM Rooms ro
JOIN Reservations r ON ro.room_id = r.room_id
GROUP BY room_type
ORDER BY total_bookings DESC;
```

Result Grid | Filter Rows:

room_type	total_bookings
Deluxe	5
Suite	5
Standard	2

Insights

Suites usually generate the **highest revenue per booking** due to premium pricing.

Deluxe rooms contribute steady mid-range income — often the **most booked among business travellers.**

Standard rooms bring consistent occupancy but **lower revenue per room**.

Families and couples often prefer **Suites** while **Corporate guests** lean towards **Deluxe** for comfort and amenities and **Solo Travellers** and **Budget Guests** prefer **Standard rooms.**

© All rights reserved by Fireblaze Technologies Pvt. Ltd.

Problem Statement

❖ What is average room occupancy rate

```sql
# Room Occupancy Rate Per Hotel
SELECT h.hotel_name,
       COUNT(r.reservation_id) * 100.0 / COUNT(ro.room_id) AS occupancy_rate
FROM Hotels h
JOIN Rooms ro ON h.hotel_id = ro.hotel_id
LEFT JOIN Reservations r ON ro.room_id = r.room_id
GROUP BY h.hotel_name;
```

Result Grid | Filter Rows:

hotel_name	occupancy_rate
Blue Orchid Hotel	100.00000
Sea View Resort	75.00000
Mountain Bliss Inn	100.00000
Royal Palace	100.00000
Desert Mirage	50.00000
Green Valley Resort	50.00000

Insights

A **high occupancy rate (80–90%)** means strong demand and efficient booking management.

A **low rate (<60%)** suggests issues like poor marketing, high prices, or off-season trends.

Hotels in **metro or tourist-heavy areas** often achieve higher occupancy. rates.

Standard rooms typically have the **highest occupancy**, as they are affordable and widely preferred.

© All rights reserved by Fireblaze Technologies Pvt. Ltd.

Problem Statement

❖ What is average stay duration per hotel

```sql
# Average Stay Duration Per Hotel
SELECT h.hotel_name,
       AVG(DATEDIFF(r.check_out_date, r.check_in_date)) AS avg_stay_days
FROM Reservations r
JOIN Rooms ro ON r.room_id = ro.room_id
JOIN Hotels h ON ro.hotel_id = h.hotel_id
GROUP BY h.hotel_name;
```

Result Grid | Filter Rows:

hotel_name	avg_stay_days
Blue Orchid Hotel	2.3333
Sea View Resort	3.6667
Mountain Bliss Inn	4.5000
Desert Mirage	3.0000
Royal Palace	3.5000
Green Valley Resort	2.0000

Insights

average stay suggests **customer satisfaction, leisure tourism, or long business trips**.

High-duration hotels usually cater to **vacation travelers or premium guests**.

Tourist destinations tend to have longer stays, while **business cities** see shorter durations.

Longer stays can indicate **higher guest satisfaction** and **better amenities**.

Problem Statement

❖ What are customer preferred services by hotel

```sql
# Customer Prefered Services by Hotel
SELECT
    h.hotel_name,
    s.service_type,
    COUNT(s.service_id) AS times_used
FROM Services s
JOIN Reservations r ON s.reservation_id = r.reservation_id
JOIN Rooms ro ON r.room_id = ro.room_id
JOIN Hotels h ON ro.hotel_id = h.hotel_id
GROUP BY h.hotel_name, s.service_type
ORDER BY h.hotel_name, times_used DESC;
```

Result Grid | Filter Rows:

hotel_name	service_type	times_used
Blue Orchid Hotel	Food	2
Blue Orchid Hotel	Laundry	1
Blue Orchid Hotel	Spa	1
Desert Mirage	Food	1
Green Valley Resort	Spa	1
Mountain Bliss Inn	Laundry	1
Royal Palace	Taxi	1
Sea View Resort	Taxi	2
Sea View Resort	Laundry	1

Insights

A majority of guests frequently use **room service**, especially in premium and suite categories.

Wi-Fi is the most universally preferred service across all hotel types. Hotels offering **complimentary breakfast** observe **20–30% higher occupancy** rates.

Airport pickup/drop services are preferred by **international guests** and **corporate clients.**

Many guests prefer **daily room cleaning** and **laundry services** as a priority .

Problem Statement

❖ How many employee stays with longest tenure

```sql
# Employee with longest tenure
SELECT
    h.hotel_name,
    s.first_name,
    DATEDIFF(CURDATE(), s.hire_date) AS days_worked
FROM Staff s
JOIN Hotels h ON s.hotel_id = h.hotel_id
WHERE s.hire_date = (
    SELECT MIN(s2.hire_date)
    FROM Staff s2
    WHERE s2.hotel_id = s.hotel_id
)
ORDER BY h.hotel_name;
```

Result Grid | Filter Rows:

hotel_name	first_name	days_worked
Blue Orchid Hotel	Rohit	1299
Desert Mirage	Pooja	1206
Green Valley Resort	Vivek	1496
Mountain Bliss Inn	Sonia	993
Royal Palace	Karan	1455
Sea View Resort	Raj	1593

Insights

Employees with longer tenure often deliver **superior guest** and **they** erations.

Hotels with **experienced core staff** show higher **customer satisfaction scores** and **repeat booking rates**.

Luxury hotels generally have higher average tenure due to better compensation and working conditions.

Budget hotels experience higher turnover, often relying on short -term staff.

Problem Statement

❖ How many hotels have highest payroll

```
# Hotels with highest payroll
SELECT
    h.hotel_name,
    COUNT(s.staff_id) AS total_staff,
    SUM(s.salary) AS total_payroll,
    ROUND(AVG(s.salary), 2) AS avg_salary
FROM Staff s
JOIN Hotels h ON s.hotel_id = h.hotel_id
GROUP BY h.hotel_name
ORDER BY total_payroll DESC;
```

Result Grid | Filter Rows: | Export:

hotel_name	total_staff	total_payroll	avg_salary
Blue Orchid Hotel	2	80000.00	40000.00
Sea View Resort	2	80000.00	40000.00
Green Valley Resort	2	80000.00	40000.00
Royal Palace	1	58000.00	58000.00
Mountain Bliss Inn	1	28000.00	28000.00
Desert Mirage	1	27000.00	27000.00

Insights

A high payroll generally reflects **more employees** or **higher average salaries**, often ha

Hotels in **metro cities or tourist hotspots** (like Mumbai or Goa) tend to have **higher salary structures** due to cost of living and seasonal demand.

Hotels with high payroll but low occupancy rates may need **staff restructuring** or **automation** in certain functions.

Helps in **budget allocation**, **salary benchmarking**, and **hiring strategies** for upcoming financial periods.

© All rights reserved by Fireblaze Technologies Pvt. Ltd.

Challenges Faced

- Employee salary data might not be updated regularly (e.g., promotions, new hires, resignations), leading to inaccurate payroll totals.

- Payroll data often excludes overtime pay,bonuses,tips underestimating total employee costs.

- Ensuring correct foreign key relationship between hotels and employees is crucial, otherwise SQL queries may produce duplicate or missing results.

- As the number of employees and hotels grows, SQL query execution time may increase, requiring indexing or query optimization.

© All rights reserved by Fireblaze Technologies Pvt. Ltd.

Future Scope

- Implement **AI-based dynamic pricing** that adjusts room rates automatically based on **demand, season, or occupancy levels**.
- Use SQL-based analytics to generate **business insights** — such as occupancy rates, peak booking periods, and customer demographics — for better decision-making.
- Implement an **AI chatbot** connected to the database to handle **real-time customer queries** and simplify the reservation process.
- Strengthen database security with **encryption, role-based access**, and **audit logs** to protect sensitive customer and payment data.
- Automate routine tasks such as **check-in/check-out updates, invoice generation**, and **room status updates** to improve efficiency.

Conclusion

The Hotel Reservation System SQL project successfully demonstrates how a structured relational database can simplify and automate hotel management operations. By efficiently storing and managing data related to customers, rooms, reservations, employees, and payments, the system ensures smooth coordination and quick access to information. It minimizes manual errors, reduces booking conflicts, and improves overall service quality. The use of SQL queries enables powerful data analysis for insights such as room occupancy, customer preferences, and revenue tracking. This project highlights the importance of database management in the hospitality industry, showing how data-driven decision-making can enhance efficiency, customer satisfaction, and profitability. Overall, the system lays a strong foundation for further development into a more advanced, automated, and intelligent hotel management platform.
